

8     **ABSTRACT**

9     Data packets are received at a communications node. Each of the  
10    received data packets is associated with one of a set of different  
11    service classes. Packets corresponding to the received data packets  
12    are transmitted to recipients. The order in which the data packets  
13    are transmitted is controlled based on the transmission rate and the  
14    service class of the packets.
